

Candida auris 'At-a-Glance'

Definition	<i>Candida auris</i> (<i>C. auris</i>) is an emerging multi-drug resistant fungal pathogen which can affect both adult and paediatric patients, largely within high-risk healthcare settings such as ICU. <i>C. auris</i> infections have been reported in bloodstream, bone, cerebrospinal fluid & intra-abdominal infections. Sites that can be commonly colonised in hospitalised patients include the axilla, groin, nose, rectum, respiratory and urinary tract. Colonised patients shed <i>C. auris</i> readily into the clinical environment & on to multi-use equipment and survival times for the organism of 7 days have been recorded.												
Screening & Management of Suspected or Confirmed Patients	<table><tr><th>Who to screen</th><th>Isolate</th><th>Sites to screen</th><th>When to stop isolation</th></tr><tr><td> Patients admitted from other affected hospitals or units in the UK. Patients who have had an overnight stay in a healthcare facility outside the UK in the past year or admitted from a hospital overseas. Admissions or transfers to intensive care from abroad are higher risk – please discuss with IPC </td><td>Yes</td><td> Axilla, Groin, Broken areas of skin, Any drain fluids, Urine sample if catheterised </td><td> When 1 complete set of screens confirmed as negative Patients newly identified with <i>C. auris</i> must be isolated for the duration of their hospital stay </td></tr><tr><td> Patients known to be previously colonised or infected (Check Biohazard flag on EPR) Or clinical information from another Trust ***FLAG*** </td><td>Yes</td><td> Axilla, Groin, Broken areas of skin, Any drain fluids, Urine sample if catheterised </td><td> Patients in intensive care or surgical settings to remain isolated for their admission even if screens are negative Other ward areas stop isolation when 3 screens collected >24 hours apart are negative & discussed with IPC </td></tr></table> Implement for confirmed positive and while waiting for results: - Isolate in a single room, preferably ensuite but dedicated commode as a minimum - Door closed with contact isolation contact sign on the door - Contact precautions including hand hygiene - Gloves and aprons are to be worn during contact with the patient or environment, or longsleeved gowns where there is a risk of extensive splashing of blood and/or other body fluids. - Put used linen in red alginate bags then white plastic linen bag. - If the patient is transferred, please inform receiving staff of patient's infection status, including radiology, theatres or other hospital departments. - Visitors need to be informed about the infection & clean their hands, using alcohol hand gel before & after touching patients or any items around the bedside. They need to wear a gown, aprons and gloves if prolonged close contact is required or providing direct care. - When discharging infected/colonised patient to another healthcare setting, please complete the 'Inter-Healthcare Infection Prevention and Control transfer form'	Who to screen	Isolate	Sites to screen	When to stop isolation	Patients admitted from other affected hospitals or units in the UK. Cleaning	• All patient equipment must be cleaned with Green Universal Clinell wipes after use. • Where possible use patient dedicated or single use equipment such as temperature probes or blood pressure cuffs. • A second daily enhanced second clean of the side room for a patient with <i>Candida auris</i> should be requested via the Help Desk and a terminal clean on discharge. • If a known colonised/infected patient needs to be transferred to theatre or x-ray/radiology for imaging, they should be scheduled last on the list for the day and an enhanced clean completed by theatre or X-ray on completion of the procedure.
